Common GIS Issues/Errors

Brief Problem Description Full

Symbol Selector palette partially disappears
In ArcMap, when the symbol selector is in use (changing symbology), the color palette partially disappears into the top of the screen. Only a third of the palette is available for use unless the symbology box is dragged further down onto the monitor. (See attachment).

Common Questions

What are subtypes?
In geodatabases, a subtype is a way to categorize features that share the same attributes. For example, streets are categorized into 3 subtypes: local streets, collector streets, and arterial streets. Creating subtypes can be more efficient than creating many feature classes or tables in a geodatabase; fewer feature classes with subtypes performs better than many feature classes with no subtypes and editing is faster and more accurate because default attribute values and domains can be set up.

What are domains?
In a geodatabase, a mechanism for enforcing data integrity. Attribute domains define what values are allowed in a field in a feature class or nonspatial attribute table. If the features or nonspatial objects have been grouped into subtypes, different attribute domains can be assigned to each of the subtypes.

Vision and Mission Statement

"Plans, Programming, Policies, Prioritization and Resources"

Vision. Marine Corps Installations West (MCIWEST) will provide the Operating Forces and tenant commands with the highest quality of continuous, effective service and support to meet present and anticipate future joint and expeditionary warfare requirements.

Mission. Marine Corps Installations West (MCIWEST) implements policies, develops regional strategies and plans, prioritizes resources and provides services, direction and oversight through command of assigned U. S. Marine Corps Installations in order to support the Operating Forces, tenant commands and activities.
